Project Title: Secure Pharmacy Inventory and Prescription Management System with Medicine Stock Tracking

Module Photographs:

Project Description: Module 2 – Prescription & Patient Medicine Management

The project “**Secure Pharmacy Inventory and Prescription Management System with Medicine Stock Tracking**” focuses on developing a simple and reliable system for managing medicine inventory, patient information, prescriptions, stock quantities and expiry details. The system uses the C programming language with Structures, Arrays, Strings and File Handling to store and manage pharmacy records efficiently. In **Module 2 – Prescription & Patient Medicine Management**, patient details and prescription information are maintained in an organized manner. The system allows the user to create patient records and associate prescribed medicines with the corresponding patient. Prescription details such as medicine name, dosage and quantity are recorded and stored using structured data and file-based storage. The module also provides searching, retrieval and updating of patient and prescription records whenever required. Based on these functions, the module provides an efficient method for maintaining accurate patient medicine information and reduces the difficulties associated with manual record keeping. The prescription and patient medicine management module forms an important part of the proposed pharmacy management system by providing the patient and prescription information required to work together with the medicine inventory and stock-monitoring modules.
